

SDS TILES & CERAMICS

Design and Motion Guide

Colours, type, animation, 3D effects and mobile rules for the Virtual Trial Room. The colours and fonts match what the app already uses, and the code snippets are ready to copy.

1. Look and feel

The brand is warm, premium and calm, like a quality showroom: soft cream backgrounds, clay and stone browns, one dark accent for buttons, and a serif headline font for a classic feel. Keep everything else quiet so the customer's tiles are the star.

Colour palette

Name	Colour	Use it for
Clay 50 (#faf6f1)		Page backgrounds, soft cards
Clay 100 (#f3ebe1)		Highlight panels, hover fills
Clay 300 (#d4b892)		Borders on selected items
Clay 500 (#ab8050)		Icons, small accents
Clay 700 (#725136)		Links and text buttons
Clay 900 (#4c3829)		Dark brown headings on cream
Stone 900 (#1c1917)		Main text and primary buttons
Stone 950 (#0d0c0b)		Dark hero sections
Red 700 (#b91c1c)		Delete and error messages

Typography

Role	Font	Size on phone / desktop
Headlines	Fraunces (serif)	28 px / 40 px, semi-bold
Section titles	Fraunces	20 px / 24 px
Body text	Inter	15 px / 16 px, line height 1.6
Small labels	Inter, uppercase, wide spacing	11-12 px, semi-bold

Spacing, corners and shadows

- Use steps of 4 px: 8, 12, 16, 24, 32, 48.
- Cards: 16 px rounded corners. Bottom sheets and big panels: 24 px.
- Card shadow: soft and wide, never dark or sharp.
- Buttons are at least 44 px tall so thumbs hit them easily.

2. Animation rules

Good animation explains what happened. Bad animation slows people down. Use these timings everywhere so the app feels consistent.

Moment	Effect	Time
Page opens	Fade in and rise 10 px	350 ms, ease-out
Cards in a list	Appear one after another	60 ms apart
Button press	Shrinks to 97 percent	120 ms
Hover on a card	Lifts 4 px, shadow grows	200 ms
Dialog or sheet	Slides up from the bottom on phones, fades in on desktop	250 ms
Result reveal	Before and after slider fades in	500 ms
Generating preview	Progress steps with a soft pulse, never a frozen screen	Looping while waiting

Framer Motion recipes (already installed)

```
// Fade and rise
<motion.div initial={{ opacity: 0, y: 10 }}
  animate={{ opacity: 1, y: 0 }}
  transition={{ duration: 0.35, ease: 'easeOut' }} />

// Staggered list
const list = { show: { transition: { staggerChildren: 0.06 } } };
const item = {
  hidden: { opacity: 0, y: 12 },
  show: { opacity: 1, y: 0 },
};

// Press feedback
<motion.button whileTap={{ scale: 0.97 }} whileHover={{ y: -2 }} />
```

Always respect people who turn motion off in their device settings. The background mist already switches itself off in that case. For other animations, wrap the app in MotionConfig with reducedMotion set to user, so one setting covers everything.

3. 3D effects and realistic visuals

These effects add depth without heavy 3D libraries, so the app stays fast on phones.

Tilting tile cards

When the mouse moves over a tile card, the card leans slightly, like holding a real tile sample.

```
.tile-card { transform-style: preserve-3d; perspective: 900px;
  transition: transform 200ms ease-out; }
.tile-card:hover {
  transform: rotateX(4deg) rotateY(-6deg) translateY(-4px);
}
```

Glossy shine on tiles

```
.shine { position: relative; overflow: hidden; }
.shine::after { content: ''; position: absolute; inset: 0;
  background: linear-gradient(115deg, transparent 40%,
    rgba(255,255,255,.35) 50%, transparent 60%);
  transform: translateX(-120%); transition: transform 700ms; }
.shine:hover::after { transform: translateX(120%); }
```

Depth for hero sections

- Layer 2 or 3 images that move at different speeds when scrolling (slow background, faster foreground) for a parallax feel.
- Soft shadow under floating objects, in a darker tone of the page, never pure black.
- Gentle gradient on dark sections, from Stone 950 to Stone 925.

Realistic previews

- Show the before and after slider full width on phones, with zoom.
- Keep a thin white divider and a round handle, as in the current design.
- Always store the real tile size in millimetres so tiles look the right size in the room.
- A true 3D room walkthrough is a separate project: it needs a 3D model of the room and a library such as Three.js.

4. Mobile rules

Most customers will look at this on a phone beside the tile shelf. Follow these rules on every page.

Screen	Width	Layout
Phone	under 640 px	One column, bottom sheets for pickers, big buttons
Tablet	640 to 1023 px	Two columns for cards
Laptop and up	1024 px and more	Side panel plus main area

- No sideways scrolling. The public pages were checked at phone width and have none.
- Touch targets are at least 44 by 44 px, with space between them.
- Pickers open as a sheet from the bottom of the screen and close by tapping outside.
- The Preview button stays visible at the bottom while designing.
- Images load lazily and at the size they are shown.
- Decorative animation is lighter on phones: fewer particles and a lower frame rate.

5. Speed rules (no waiting around)

- Pages load only when opened, so the first screen is small.
- Big libraries are cached separately and stay cached between updates.
- A loading placeholder shows while a page opens, so the screen is never blank.
- If a page crashes, a recovery screen with a Reload button appears instead of a white page.
- Generation shows clear progress steps, and the credit hold is released automatically if it fails.

These guidelines make the app feel polished and responsive, but nothing can make an AI-generated preview an exact measurement. Always confirm real tile quantities and layout on site.
